# Bio-assessment: using aquatic organisms to learn about river health 

ASSESSMENT OF BIOTIC INTEGRITY USING FISH
COMMUNITIES
James R. Karr

ABSTRACT

 suppocting tiem.

WHY MONITOR FISH?
Biological communites reflet watershed conditions since they
 Many groups of orgatisms have been proposed as indyatorss oh
environmental quality but no single group has emerged as the

## Flow-ecology relationships

## Use of the relationships

$\square$ Piedmont

## Purpose

- To provide insight on the potential response of organisms to the alternate water withdrawal scenarios produced by SWAM.
- We aim to put the SWAM results into a biological context.
- High demand water use scenario: 100 to 60 cfs

## How will this work? Step 1

Species richness

Legend

- Fish sites
- Macroinvertebrate sites

HUC6

variable — USGS - WaterFALL

## How will this work? Step 2

## How will this work? Step 3

Selected relationships

## Step 1: Quantify the flow-ecology relationships

Contents lists available at ScienceDirect
Science of the Total Environment

Quantifying flow-ecology relationships across flow regime class and ecoregions in South Carolina

## Framework

- The ecological limits of hydrologic alteration (ELOHA). Poff et al., 2010

Build a hydrologic foundation of streamflow and biological data
B. Classify natural river types
C. Model and select flow ecology relationships
$\square$ Blue Ridge
Southern Coastal Plain
Southeastern Plain
Middle Atlantic Coastal Plain
$\square$ Piedmont

## Biological Data:

- 492 Fish sites (streams \& rivers)
- DNR
- 8 biological response metrics
- 530 aquatic insect sites
- DHEC
- 6 biological response metrics

## Characterizing aquatic diversity

- Species richness: number of species
- Shannon's Diversity: Accounts for percentages Tolerant

Diverse biota = healthy ecosystem

## Hydrologic data

## Build a hydrologic foundation of streamflow data

- WaterFALL model:
- rainfall-runoff model 30-year period
- Accounts for withdrawals, discharges, and reservoirs within the river network
- 24 hydrologic metrics
- Flow regime: Timing, magnitude, frequency, rate of change, and duration

Predictability of flow metrics calculated using a distributed hydrologic model across ecoregions and stream classes: Implications for developing flow-ecology relationships
 Brandon K. Peoples ${ }^{3}$ ©

## Relevance of flow regime components

Flow regime components: magnitude, frequency, duration, timing, and rate
Edisto River NR Givhans, SC - 02175000
June 16, 2022 - June 16, 2023
Streamflow, $\mathrm{ft}^{3} / \mathrm{s}$ ©
$2110 \mathrm{ft} 3 / \mathrm{s}$ - Sep 14, 2022 09:30:00 PM EDT

## Relevance of flow regime components

## Broad River at Alston, SC - 02161000

June 16, 2022 - June 16, 2023
Streamflow, $\mathrm{ft}^{3} / \mathrm{s}$ i

Edisto River NR Givhans, SC - 02175000

Streamflow, $\mathrm{ft}^{3} / \mathrm{s}$ ©

## Reedy River Near Greenville, SC - 02164000

June 9, 2023 - June 16, 2023
Streamflow, $\mathrm{ft}^{3} / \mathrm{s}$ ©

## Relevance of flow regime components

- Magnitude: MA1 (mean daily flow) and ML17 (base flow)
- Alteration of habitat
- Reduced water quality and higher mortality

- Duration: DL16 (duration of lov
- Alteration of connectivity
- Increased duration of low water c
- Timing: TL1 (timing of low flow
- Loss of access to habitats
- Disruption of life-cycle cues (spa migration) and decreases in recr
- Invasion of exotics

## Framework

- The ecological limits of hydrologic alteration (ELOHA). Poff et al., 2010
A. Build a hydrologic foundation of streamflow and biological data
C. Model and select flow ecology relationships

## 2. Classify natural river types

A. Flow-ecology relationships may differ among stream classes
A. Ecoregion
B. Hydrologic class

## Framework

- The ecological limits of hydrologic alteration (ELOHA). Poff et al., 2010
A. Build a hydrologic foundation of streamflow and biological data
B. Classify natural river types

Model and select flow ecology relationships

## Identify relationships: some are informative

24 Flow metrics 14 Biotic metrics

## Identify relationships: some are not informative

## Identify relationships: remove uninformative relationships

## Results summary

- We found >180 informative relationships across SC
- Predicting responses
- Defining biological response limits
- Many of these differed among stream classes

| Scenario | Loss of <br> species | Risk |
| :--- | :--- | :--- |
| MD | $15 \%$ | Med |
| HD | $25 \%$ | High |

- All components of the flow regime were important to aquatic organisms
- magnitude, frequency, duration, timing, and rate
- Next steps:
- Identify those relevant to the Saluda

- Present these proposed relationships to the RBC
